HUNTING DOWN THE MOSQUITO

**Pests Being Hunted With Plants,
Oil, Carbide, Spades, Fish
and Sanitation.**

The mosquito campaign, for the con-
duct of which the shippers' wharf com-
mittee of Honolulu has placed at the
disposal of the board of health the sum
of \$1000 per month, has now been estab-
lished in full force and is working along
smoothly and efficiently with other de-
partments of the board which are co-
ordinated therewith. A mosquito cam-
paign necessarily means in part a sani-
tation campaign, since it involves the
removal of breeding places of mosqui-
toes, such as rubbish, tin cans, bottles,
accumulation of garbage, and the drain-

age and filling in of low and stagnant
pools. For this reason the sanitation
department of the board works in co-
ordination with the mosquito campaign.
There are eleven mosquito inspectors,
and eight sanitary inspectors, who, to-
gether with the heads of the sanitation
and mosquito campaign departments of
the board, are working on this matter.
Fifty oil stations have been established
throughout the city and suburbs. An
automobile truck has been purchased,
which will greatly facilitate the work
of the mosquito and sanitation cam-
paign, as well as the work of quaran-
tine and disinfection and fumigation.

Work Last Month.

The report for the month of May
shows that the mosquito bureau took
action during the month in 23,191 cases;
this does not include inspections made
by the sanitation department. During
the month there were mosquitoes found
and disposed of in 6769 cases, and 1689
gallons of oil were used. In addition
to this there were 220 loads of tin cans,
bottles and other rubbish disposed of.
Mosquito fish were distributed in 142
places during the month.

A Plant Ally.

Concurrently with the conduct of the
work in part described above, the heads
of the mosquito and sanitation depart-

ments have conducted experiments with
the Azolla plant. This is a plant that
grows from a spore. It is procured
mainly from Germany, though it is
found in Brazil and flourishes in great
quantities on the Mississippi River.
The plant grows in fresh water. The
individual plant is almost minute in
size, the leaves being about the size
of a pinhead, resembling the clover
leaf. The root extends below the plant
into the water an inch or two. This
plant multiplies exceedingly rapidly,
and its value in mosquito work lies
in the fact that it will completely cover
the surface of the water, so completely
that wrigglers can not get through it
to the surface for air, and hence are
destroyed.

Experiments are being conducted
very carefully with this plant, it
being appreciated that every precau-
tion should be taken lest the introduc-
tion of the plant prove a pest or a
nuisance. The characteristic of the
plant that it will not spread from place
to place, but multiplies upon itself in
one locality, and that it can be easily
destroyed, lies in its favor.

Other Experiments.

Other experiments are being carried
on with calcium carbide and with lime.
It has been found that the use of crude

oil in the catch basins of the drainage
system of the city, while efficacious for
the destruction of mosquitoes, has
clogged the catch basins and been a
source of annoyance to those having
them in charge, hence some other means
had to be employed; and, after consid-
erable experimentation, calcium carbide
was selected. At first thought this
would appear an expensive expedient,
but it has been found that a quarter
of a pound of calcium carbide, properly
applied, is sufficient for each catch basin,
and the expense is very little more than
for oil. The calcium carbide is remark-
ably efficacious in the destruction of
mosquitoes, equally if not more so than
oil. Necessarily this means can be em-
ployed only in open containers.

Filling and Draining.

A mosquito elimination campaign also
includes the filling in of stagnant pools
and all low places. A good deal of
work has been done along this line,
and more is contemplated along more
extended lines. With the cooperation
of the garbage and street departments
of the city and county and the public
works department, and with the or-
ganization and force of the board of
health department, much can be accom-
plished in this direction. There is no
branch of a mosquito elimination cam-

paign more important than the drainage
and filling in of low places. In this and
in other branches of the work the own-
ers of private lands and householders
can render valuable assistance. In fact,
the little or much done here and there
by the owners of land and by the house-
holders will accomplish greater results
than can be accomplished in the same
given time by government organiza-

Mutual Courtesy.

Necessarily the appearance of a mos-
quito, or sanitary inspector on the
premises and the carrying out of their
work may occasionally be a source of
annoyance to the householder. These
inspectors have been instructed to ex-
ercise the utmost courtesy and consid-
eration compatible with the perform-
ance of their duties, and under no cir-
cumstances, no matter how addressed or
treated or spoken to, to be discourteous
to the householder. If their orders are
stated interposed by the householder,
or receive discourteous treatment, the
inspectors have been instructed to do
nothing more than to make a note there-
of in their books and to report the same
to their superiors. Hence President
Mott-Smith asks that under all the cir-
cumstances the owners of land and

TO PARENTS

who wish to enroll children in Mrs.
Hendry's school:
It having been necessary during the
past year to refuse many children for
lack of space, early applications will
be made for permit arrangements to be made for
sufficient room during the coming year,
present accommodations admitting but
few more than already registered.
It is also necessary to know now what
books to order, that there may be no
delay at the beginning of the term.
19, 23, 25

householders cooperate with the work
of this bureau by exercising patience
and showing a due regard for the neces-
sity which compels the inspector to per-
form his duty.

The report of the sanitation depart-
ment shows that during the month of
May there were 13,435 inspections made,
1815 orders given and 1771 orders fin-
ished. In addition to this the sanitary
inspectors performed during the month
seventy-one and a half days of special
duty, such duty including the drawing
of district sanitation maps, the making
of special reports and the doing of
fumigation and disinfection work.
